1. Problem Statement

Global Superstore has developed various Business Intelligence reports, dashboards and analytical solutions that need to be deployed, monitored and maintained effectively. Without proper deployment planning, workspace management, performance monitoring, backup and recovery procedures, the organization may face data loss, system failures and interruptions in business operations. Therefore, there is a need to design a comprehensive BI deployment, monitoring, backup and restore strategy using Microsoft Power BI to ensure data availability, system reliability, secure access and business continuity.

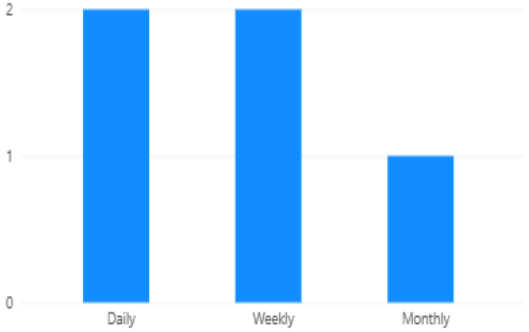

2. Solution

- Created a BI_Deployment_Plan table to identify BI assets, intended users and deployment priorities.
- Developed a Workspace_Roles table defining Administrator, Member, Contributor and Viewer responsibilities.
- Created a Workspace Structure Diagram using a Matrix visual in Power BI.
- Documented workspace governance guidelines for secure access and content management.
- Developed a Monitoring_Matrix to track dataset refresh status, dashboard usage, report performance, user activity and data accuracy.
- Created a BI Monitoring Dashboard using Card, Column Chart, Bar Chart and Table visuals.
- Designed a Backup_Schedule table specifying backup frequency, methods and responsible personnel.
- Created a Restore_Procedure table to define recovery steps for accidental deletion, dataset corruption and system failures.
- Saved a separate copy of the Power BI report as GlobalSuperstore_Backup.pbix.
- Demonstrated the restore process by reopening the saved backup file and verifying report pages and visuals.
- Developed a Disaster_Recovery table to document recovery actions and business impact.
- Analysed the accidental deletion of an executive dashboard and identified the necessary recovery steps.
- Created a final BI Deployment Dashboard combining deployment, monitoring, backup and recovery information.

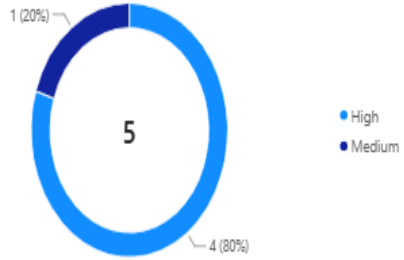

Count of Monitoring Metrics
by Responsible Person

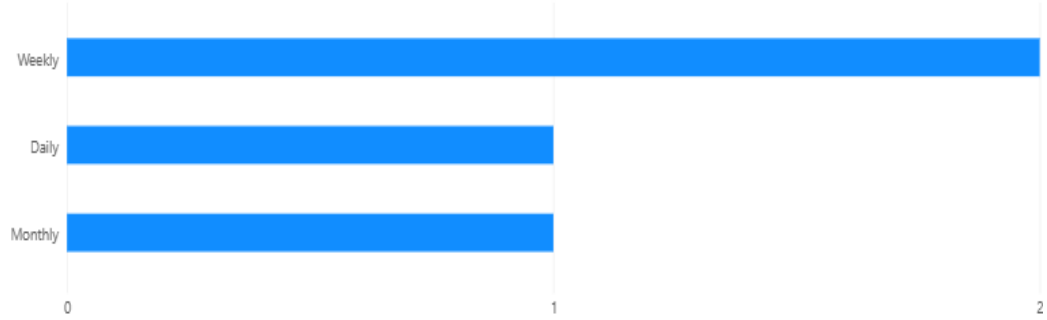

Count of Monitoring Metrics
by Monioring Frequency

Count of BI Asset
by Deployment Priority

Count of BI Component
by Backup Frequency

Monitoring Metrics	Monioring Frequency	Purpose	Responsible Person
Dataset Refresh Status	Daily	Ensure data is updated	BI Administrator
Report Performance	Weekly	Identify slow reports	BI Administrator
Dashboard usage	Weekly	Track dashboard usage	BI Analyst
Data Accuracy	Monthly	Verify data correctness	Data Analyst
User Activity	Daily	Monitor user access	Security Administrfator
